AB Lectins are proteins or glycoproteins of non-immune origin capable of binding to one or more specific sugar residues. The potential for using lectins as a means of locating and \*\*\*anchoring\*\*\* a \*\*\*drug\*\*\* \*\*\*delivery\*\*\* system to a \*\*\*target\*\*\* \*\*\*site\*\*\* on a mucosal surface in order to promote controlled \*\*\*drug\*\*\* \*\*\*delivery\*\*\* and enhanced absorption has been described in previous work. Toxicity is evident for many lectins, and this study has investigated the cytotoxicity of lectins to cells derived from the cornea and conjunctiva. Cultures of transformed cell lines from the conjunctiva and cornea were exposed to soln. of lectins, and the viability of these cells assessed by their ability to take up an MTT stain relative to the control. Clear evidence of lectin cytotoxicity was apparent for all of the lectins tested in this study, particularly at higher concns. and over the longer (48 h) time period. This would raise issues with their potential use in targeted \*\*\*drug\*\*\* \*\*\*delivery\*\*\* systems. The lectins from *Lycopersicon esculentum* and *Helix pomatia* appeared to show the least cytotoxic activity and so could be considered the most promising. The lectins from *Solanum tuberosum* and *Triticum vulgare* showed significant cytotoxicity, which contrasts with previous in-vivo studies. However, they might be considered for investigation as targeted therapeutic agents in the treatment of malignant diseases.
